**Abstract** - This document contains the solution to Lines and planes problem

## Problem:

Find the equation of the plane passing through the line of intersection of the planes

$$(\mathbf{1} \quad \mathbf{1} \quad \mathbf{1}) \cdot \mathbf{X} = \mathbf{1},$$

$$(\mathbf{2} \quad \mathbf{3} \quad -\mathbf{1}) \cdot \mathbf{X} = -\mathbf{4}$$

and parallel to X-axis.

## Solution:

Equation of plane 1 :

$$(\mathbf{1} \quad \mathbf{1} \quad \mathbf{1}) \cdot \mathbf{X} = \mathbf{1} \quad (1)$$

Equation of plane 2 :

$$(\mathbf{2} \quad \mathbf{3} \quad -\mathbf{1}) \cdot \mathbf{X} = -\mathbf{4} \quad (2)$$

Let the equation of plane 3 which passes through line made by intersection of planes 1 and 2 and being parallel to X-axis :

$$(\mathbf{0} \quad \mathbf{p} \quad \mathbf{q}) \cdot \mathbf{X} = \mathbf{c} \quad (3)$$

Now if three planes are passing through same line Then the Echelon matrix form obtained must be of form :

$$\left( \begin{array}{ccc|c} x & x & x & x \\ 0 & x & x & x \\ 0 & 0 & 0 & 0 \end{array} \right)$$

The augmented matrix from three planes :

$$\left( \begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 2 & 3 & -1 & -4 \\ 0 & p & q & c \end{array} \right) \quad (4)$$

Performing the following row operations on (4)

$$r_2 \rightarrow r_2 - 2 \cdot r_1 \quad (5)$$

$$r_3 \rightarrow r_3 - p \cdot r_1 \quad (6)$$

we end up with

$$\left( \begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 0 & 1 & -3 & -6 \\ 0 & 0 & q+3 \cdot p & c+6 \cdot p \end{array} \right) \quad (7)$$

To convert this matrix to Echelon form for three planes passing through same line the last row must be made zeroes.

$$\Rightarrow \mathbf{q} = -\mathbf{3p} \quad \& \quad \mathbf{c} = -\mathbf{6p} \quad (8)$$

Therefore the required plane equation :

$$(\mathbf{0} \quad \mathbf{p} \quad -\mathbf{3p}) \cdot \mathbf{X} = -\mathbf{6p} \quad (9)$$

Normalizing with 'p' our plane equation becomes,

$$(\mathbf{0} \quad \mathbf{1} \quad -\mathbf{3}) \cdot \mathbf{X} = -\mathbf{6} \quad (10)$$
